Abstract. This study delves into the intricate relationship between studying unemployment rates and their implications for individuals and societies, aiming to shed light on the significant challenges posed by unemployment. Persistent in nature, this issue disrupts the socioeconomic stability of nations and adversely affects the well-being of individuals. In order to comprehend the complexities surrounding unemployment, it is crucial to conduct comprehensive research through extensive literature review and analysis of relevant data. This research explores the various reasons why the study of unemployment is crucial. It specifically investigates the role of educational attainment in fostering economic growth and curtailing unemployment rates at the societal level. By delving into this topic, this study adds to the existing body of knowledge pertaining to the influence of studying unemployment rates. These findings not only enrich the understanding of the subject but also provide valuable insights that can guide policymakers and educators in devising effective strategies to combat unemployment. Understanding the impact of education on unemployment is paramount in striving towards the creation of a more inclusive and equitable job market. By equipping individuals with the necessary knowledge and skills, societies can work towards reducing unemployment and ensuring equal opportunities for all. This study, therefore, holds substantial relevance in empowering societies to address the persistent challenge of unemployment and foster sustainable economic development.

Keywords: China; unemployment; government; school.

1. Introduction

Unemployment is a pressing social and economic issue that affects individuals, communities, and nations worldwide. As policymakers and researchers strive to mitigate the negative impacts of unemployment, understanding the factors that contribute to its prevalence and persistence becomes crucial. This study aims to investigate the influence of studying unemployment rate. By analyzing the relationship between education and unemployment, this research seeks to shed light on the potential role that studying plays in combating unemployment and fostering economic growth. Furthermore, the findings of this study may provide valuable insights for policymakers and educators in designing effective interventions and strategies to address the challenges posed by unemployment.

2. Influence

2.1. Policy Formulation

This study examining the relationship between unemployment rate and Chinese graduates can play a crucial role in policy formulation. Policymakers rely on evidence-based insights to shape effective policies and programs that address key societal challenges. In the case of graduate unemployment, the findings from this study can inform policy decisions aimed at improving employment conditions and reducing unemployment rates among graduates. From the perspective of policy demand, the purpose of estimating the natural unemployment rate is to clarify the short-term quantitative relationship between labor market dynamics and changes in price levels and output levels.

One major influence this research can have is in identifying the effectiveness of existing policies. Analyzing data and conducting in-depth research can assess the impact of past policies and initiatives designed to address graduate unemployment. This analysis can shed light on the strengths and weaknesses of these policies, helping policymakers understand their limitations and areas for
improvement. If research findings suggest that certain policies have been successful in reducing graduate unemployment rates in specific regions or industries, policymakers can study and replicate those successful aspects on a broader scale. Conversely, if certain policies have not yielded the desired outcomes, policymakers can reevaluate and modify them accordingly. For example, by analyzing the composition of unemployment rates in terms of natural unemployment and cyclical unemployment, it is possible to determine the direction and intensity of policy tools related to “stable employment” issues [1]. Similarly, Lidao He, Lei Xu, and Yinjie Wang concluded that these newly-added young working-age population have lost employment opportunities due to the implementation of the delayed retirement system in their study of unemployment [2]. Through research, it has been found that family planning policies have a strong negative correlation with unemployment, and they also exhibit a lag effect [3].

Furthermore, studying the influence of unemployment rate on Chinese graduates can help policymakers understand the specific challenges faced by graduates in the job market. This research can identify factors contributing to graduate unemployment, such as a skills mismatch, lack of industry experience, or limited networking opportunities. Armed with this knowledge, policymakers can design targeted interventions to address these challenges and support the transition of graduates from education to employment. One possible policy intervention is the alignment of curricula and programs with market needs. Analyzing the demand for specific skills and knowledge in the job market can provide valuable insights to educational institutions. Policymakers can then work alongside universities to revise and update curricula to ensure they equip graduates with the skills and knowledge that are in high demand. This can involve introducing new courses or modules, emphasizing practical training, and promoting interdisciplinary learning to enhance graduates’ employability. Another crucial aspect is the inclusion of internships, practical training, and career guidance programs within the education system. Such initiatives can bridge the gap between the classroom and the job market, providing students with real-world experience and exposure to industry practices. Research on the outcomes of these programs can help policymakers identify effective models and establish guidelines to promote their widespread implementation. Additionally, collaboration between educational institutions and industry partners can facilitate the creation of internship and apprenticeship opportunities, nurturing a talent pool that is better equipped to enter the workforce. Based on the study of unemployment rate, Xiaorong Jiang and Yang Zhang concluded that Chinese government should improve the unemployment insurance system [4].

Moreover, research on the influence of unemployment rate on Chinese graduates can inform policies that support entrepreneurship and innovation. Start-ups and small businesses can play a significant role in job creation, especially for graduates. By identifying barriers to entrepreneurship and understanding the specific needs of young entrepreneurs, policymakers can implement measures to foster a favorable entrepreneurial ecosystem. These measures may include simplifying business registration processes, providing financial incentives, offering mentorship programs, and facilitating access to resources and networks.

Ultimately, the policy formulation process heavily relies on research and evidence-based insights. By studying the influence of unemployment rate on Chinese graduates, policymakers can make informed decisions to address graduate unemployment effectively. Policies can be tailored to specific challenges and opportunities identified through research, creating a more favorable environment for graduates to find employment and contribute to economic growth.

In conclusion, policy formulation in response to graduate unemployment can be significantly influenced by research examining the relationship between unemployment rate and Chinese graduates. The findings from such research can inform the evaluation of existing policies, the identification of specific challenges faced by graduates, and the design of targeted interventions to enhance their employability. By aligning curricula with market needs, promoting practical training and career guidance, and supporting entrepreneurship, policymakers can work towards reducing graduate unemployment rates and fostering sustainable economic development.
2.2. Economic Stability

Economic stability is a crucial aspect of any country’s overall well-being and development. It refers to a state of equilibrium in economic activity, where prices, employment rates, and production levels are consistent over time. Within this framework, the employment situation, especially for graduates, plays a vital role. High graduate unemployment rates can have significant implications for economic stability, impacting individuals, families, communities, and the country as a whole. Studying and estimating the natural unemployment rate is of great significance for research on economic issues [5]. Promoting employment and controlling the unemployment rate are among the macroeconomic policy goals and undeniable responsibilities of governments worldwide. Dealing with the issue of unemployment is a critical strategic matter that relates to China’s economic development and social stability. The study of unemployment issues holds immense significance for China’s current development [6].

One of the key ways studying the influence of the unemployment rate on Chinese graduates can contribute to economic stability is through the identification of structural issues and mismatches between the skills possessed by graduates and the requirements of the job market. Understanding the underlying structural changes implied by the natural unemployment rate is crucial [1]. Unemployment among graduates often indicates a mismatch between the skills acquired through education and the skills demanded by employers. By understanding the reasons behind this mismatch, policymakers and educators can develop strategies to bridge the gap, ensuring that graduates are equipped with the relevant skills and qualifications that align with the needs of the job market. This, in turn, promotes a better match between skilled labor and job opportunities, reducing unemployment rates and fostering economic stability.

Moreover, high graduate unemployment rates can lead to underutilization of human capital, which can be detrimental to economic growth. When individuals with higher education qualifications are unable to secure suitable employment, their potential contribution to the economy remains untapped. This not only affects their personal well-being but also limits the overall productivity and competitiveness of the country. By studying the relationship between the unemployment rate and graduates, policymakers can gain insights into the specific challenges faced by this group, enabling them to design targeted interventions to better utilize and maximize their skills and talents. This can include initiatives such as entrepreneurship programs, vocational training, and internship opportunities that provide graduates with practical experience and enhance their employability.

Furthermore, graduate unemployment can have broader macroeconomic consequences. One of the influence of studying the natural unemployment rate is macroeconomic regulation based on the changes in the labor market reflected by the natural unemployment rate [1]. High unemployment rates among graduates imply a loss of human capital investment, as resources spent on education fail to yield the desired returns. This can create a cycle of reduced educational enrollment, decreased investment in skill development, and a decline in overall productivity. By understanding the impact of graduate unemployment on the economy, policymakers can recognize the importance of investing in education and creating an environment that encourages job creation and entrepreneurship. This can involve fostering innovation, supporting industries with high growth potential, and promoting entrepreneurship and start-up culture, all of which can contribute to economic stability and long-term growth.

In conclusion, studying the influence of the unemployment rate on Chinese graduates is vital for ensuring economic stability. By identifying structural issues, reducing skill mismatches, and providing targeted support, policymakers can enhance the employability of graduates, utilize human capital more effectively, and foster long-term economic growth. Moreover, addressing graduate unemployment and its broader social implications can enhance social stability, promote social mobility, and create a more inclusive society. Ultimately, these efforts contribute to a stronger, more resilient economy and a brighter future for both individuals and the nation as a whole.
2.3. Education Reform and Curriculum Design

Education plays a vital role in preparing individuals for the job market and fostering economic development. However, in an era of rapid technological advancement and evolving global economies, it is crucial that education systems keep pace with the changing needs and demands of the job market. One of the key influences that studying the influence of the unemployment rate on Chinese graduates can have is in the realm of education reform and curriculum design. Traditionally, many educational programs have been designed based on theoretical knowledge and general skills. However, in today’s competitive job market, there is a growing emphasis on practical skills and job-specific requirements. This misalignment between the skills possessed by graduates and the skills sought by employers often leads to higher unemployment rates. Hence, it becomes essential to bridge this gap through targeted education reforms. Only through reform can researchers better address the fundamental issue of people’s livelihoods - the globally challenging problem of unemployment [7].

By studying the influence of the unemployment rate on Chinese graduates, researchers can identify specific skills and qualifications that are in high demand in the job market. For example, a study might reveal that employers are seeking graduates proficient in certain programming languages, problem-solving abilities, or cross-cultural communication skills. Armed with this information, educators and policymakers can initiate curriculum changes that incorporate these sought-after skills and competencies. Curriculum design can be adapted to include more experiential learning, internships, industry collaborations, and practical projects. This approach ensures that graduates not only possess theoretical knowledge but also gain hands-on experience and develop the skills necessary to succeed in their chosen fields. By aligning curriculum content with the expected job requirements, education systems can better equip graduates with the relevant knowledge and competencies desired by employers.

Furthermore, studying the influence of the unemployment rate on Chinese graduates can also highlight the need for interdisciplinary education. Many modern industries value individuals with multidisciplinary skills and knowledge. For instance, the field of sustainable development requires expertise in environmental sciences, economics, and policy-making. By identifying such interdisciplinary areas through research, educational institutions can develop programs that merge various disciplines, enabling students to acquire a broader skill set that is highly sought after by employers.

Another aspect of education reform that can be influenced by this study is the pedagogical approach. Traditional lecture-based teaching methods may not fully equip graduates with the necessary skills for the job market. Therefore, educators can explore innovative teaching methodologies such as project-based learning, case studies, teamwork, and problem-solving exercises. These approaches encourage active learning, critical thinking, and practical application of knowledge, better preparing students for the challenges of the real world.

Moreover, the study can help identify gaps in the education system that contribute to graduate unemployment. It may reveal issues such as the lack of career guidance, limited exposure to industry practices, or inadequate resources for practical training. Armed with this information, policymakers can allocate resources to improve counseling services, establish stronger links between educational institutions and industries, and provide funding for internships, research projects, and technological infrastructure.

Additionally, the study’s findings can foster collaboration between educational institutions, employers, and professional associations. Emphasizing the cooperation among the government, industry enterprises, and schools, promoting deep employer engagement, and strengthening the alignment and effective connection between education and the labor market [8]. By understanding the specific needs of industries and the job market, universities and colleges can partner with employers to offer internships and apprenticeships, design joint research projects, and provide mentorship opportunities. These collaborations can not only enhance students’ employability but also ensure the ongoing relevance of educational programs as they evolve with industry trends.
In conclusion, studying the influence of the unemployment rate on Chinese graduates can drive education reform and curriculum design efforts. It enables policymakers and educators to identify the skills and competencies that are in demand, adapt curriculum content and teaching methodologies, bridge the gap between theory and practice, and foster collaboration between educational institutions and employers. By aligning education with the needs of the job market, educational systems can enhance graduate employability, reduce unemployment rates, and ultimately contribute to greater economic stability.

3. Limitations

The study might face challenges in accessing relevant and comprehensive data on the unemployment rate in China. Data on employment and labor market indicators are often collected and maintained by government agencies or statistical bureaus. These organizations may have specific protocols and restrictions on data access. Data availability might also be limited due to privacy and confidentiality concerns. Personal or sensitive information related to employment and unemployment may be protected by privacy laws or regulations, restricting access to specific data points or individual-level data.

Even if data is available, there may be concerns regarding its reliability and completeness. Official government statistics may have limitations in terms of data collection methods, sample sizes, coverage, or the accuracy of reporting. Inaccurate or incomplete data can introduce biases or affect the validity of the study’s findings. Transparency refers to the openness and clarity in the reporting and documentation of data. China has a significant informal economy that includes informal employment and self-employment. Feng Ge points out that Chinese countryside, as an essential place with invisible unemployment rate, has been always overlooked in the national unemployment surveys [9]. This sector often goes unreported and is not captured by traditional surveys and data sources. Therefore, the official unemployment rate may not accurately reflect the true employment situation in the country, particularly among vulnerable populations.

Different sources may use different definitions or criteria to measure unemployment. This lack of standardization can introduce inconsistencies and make it challenging to compare and combine data from various sources. The definition of unemployment or how it is measured may change over time, making it difficult to compare data across different periods. Changes in measurement methodologies, criteria, or survey instruments can impact the comparability and reliability of unemployment data.

Transparency is crucial for ensuring that researchers can access and evaluate the data sources, methodologies, and assumptions used in the study. Limited transparency in data collection and reporting can impact the study’s credibility. While researchers may perform data quality checks and validation processes, they may not have direct control over the data collection process. This can introduce uncertainties and potential errors in the data, which can impact the study’s findings. The unemployment rate is often underestimated since the government does not want to spread concern among the public. Some companies will sign short-term contracts (only for one month or less) with graduates in order to reduce the aggregate unemployment rate.

Longitudinal data that tracks individuals over time can provide valuable insights into the impact of studying on employment outcomes. However, such data may be limited or unavailable, making it challenging to examine the cause-and-effect relationship between studying and unemployment in a comprehensive manner. The unemployment rate in China is typically announced once at the end of the year, and it is calculated based on the number of unemployed individuals on the last day of the year. This cannot accurately reflect the unemployment situation throughout the year [10].

4. Conclusion

In conclusion, this research has explored the major influences of policy formulation, economic stability, and education reform and curriculum design on unemployment among modern Chinese
graduates. The findings shed light on the complex dynamics of the labor market and the multifaceted factors that contribute to employment outcomes.

Overall, this research underscores the need for a comprehensive approach to addressing graduate unemployment in China. It suggests that policy interventions, economic stability, and educational reforms should be integrated to create a holistic strategy for reducing unemployment rates and improving the employment outcomes for modern Chinese graduates.

However, it is crucial to acknowledge the limitations of this study. The research provides insights into the major influences studied, but there are also other influences.

Further research can delve deeper into the specific policies and reforms needed to tackle graduate unemployment, considering regional variations, technological advancements, and changing industry demands. By continuous monitoring, evaluation, and adaptation of strategies, policymakers and educational institutions can mitigate the challenges faced by modern Chinese graduates, fostering a more inclusive and prosperous labor market for the benefit of individuals and the overall economy.
