Abstract. As feminism causes the awakening of female consciousness, the love relationship get change these days. Is there any relationship between the social fact of the declined birth rate and the increased divorce rate and ancient China's parenting standard? The material abundance of the girls is any different nowadays and any effects caused by it are the main part the study wants to find. Focused on the influence material abundance can bring to post-00s girls. The questionnaire be used by check the material abundance ratio, benefits and drawbacks of the way using material abundance to bring up the girls and the cause factor of the malformation of the love relationship. The result shows that material abundance is a factor in the malformation of the love relationship, the benefits the material abundance are more than the limitations. For the suggestion, more and more girls should get material abundance in their growth part as in a result, most of the girls are material deprived.

Keywords: Material abundance, love view, malformation of the love relationship.

1. Introduction

1.1. Background

Nowadays the awakening of female consciousness caused by feminism influences the relationship between two gender. In ancient time, the love between two people can just be used to fill it. The prevalence of money worship makes the love relationship be a way to use the partner's money. The partner's existence are relate on financial support, not the emotional support to each other. Love concept refers to the product of economic and moral relations under certain social conditions. The love concept was formed on the basis of the maturity of sexual psychology and physiology. Love view is advancing with the times, but with the development of the times, so far, there is no unified conclusion on the concept of love view in the academic circle [1]. The money worship is to blindly worship money, to regard the value of money as the highest value, and all values should be subject to the ideas and actions of the value of money. Money worship is a kind of thinking that money can dominate everything, the pursuit of money as the highest purpose of life [2]. The malformation of the love relationship may cause different problem in our society. The divorce rate and birth rate are great enlightenment for future social change. For the divorce rate, different countries show different declined trend. Focused on the China, three greatest divorce wave happen in last two centuries. Form first divorce wave to last divorce rate, it rose from 0.18 per thousand in 1978 to 3.10 per thousand in 2020 [3]. For the birth rate, the three main idea cause most of the Chinese family don't want have a child. They are "Do not want to give birth," "dare not give birth," "can not give birth" [4]. For a result of this study, the better the fertility conditions and the better the fertility structure, the greater the support for the fertility rate should be. The decreasing birth rate shows the problem between marriage. The malformation of the love relationship has affected the harmony of the family and even the stability of the society.

1.2. Research Theme and Significance

In the ancient time, the China has a parenting standard which is material abundance on female and material deprivation on male. The research chooses one of the social fact from it. The author wants

to know is any relationship between material abundance on girls and the malformation of the love relationship in the nowadays.

2. Method

2.1. Research Object

The sampling method used is opportunity sampling. The questionnaire put is on the We-chat. The target groups are middle school students, high school students and university students. They have the chance to meet this questionnaire, they will finish it and we can have statistics to generalize the information.

2.2. Questionnaire

The main question the questionnaire focused on has three parts which are the material abundance of the girl, the love view of the girls and is any influence between these two.

For the material abundance part, the author asks about the type of school they have and how much they receive pocket money from their family to level their abundance level (just for girls). After that, the question asks about the importance of wealth in the growth stage to check the participant's own opinion to ensure that the abundance has some influence at different levels.

In the love view part, the author asks whether the feeling of love is more react to material or emotions. The potential factor to cause love is checked in the question. Also, the author uses the question of whether or not to have a love experience to judge the validity of this part.

In the influence, the author mainly focuses on using the open question to ask their own feelings about the idea of the relationship between the abundance of girls and the love view of girls. Also, the author gives some benefits and drawbacks to let participants to choose.

For some additional questions like How much do public opinion and the media influence your values and behavior? is to check if this data has which level of validity. Table 1 summarizes the information.

Table 1. Questionnaire design

Material abundance	School types	Pocket money	Idea of the wealth in the growth level
Love view	material	emotions	
influence	benefit	drawback	idea

2.3. Distribution

The deadline of questionnaire is 11.27. The total time the questionnaire will act online is about 7 days.

2.4. Hypothesis

Most of the post-00s on girls are material abundance in their life. The majority of the girls are more focused on partner's wealth when they look for their partner. The material abundance of post-00s on girls cause more demanding on their partner and hard to find a partner. The influence of the material abundance has more limitation than benefit on girls' growth.

2.5. Ensure the Validity

The author gives out a question with no link with the topic to test is the data has enough validity. That question is asking for the influence the social media can give to participants' action. The author gives five level which are a little, less, ordinary, larger and great. More participant chooses great means more lower validity this questionnaire is. In the final data, the "great" participant exceed 2%. It means the data does not get influence by someone do it randomly, prove its validity.

3. Result

3.1. Material Abundance

In this questionnaire, here are two questions to test whether the participant is born with material abundance or not. One is focused on education; the questionnaire operationalizes it to the choice of private school and the comprehensive school. After the statistics, about 85% of participants choose the comprehensive school. The rest of them choose the private school which is about 15%. Another question is using different levels of pocket money. 0-100RMB, 100-500RMB and over the 500RMB. The author assumes that over 500 RMB is the people with material abundance and the rest of choices mean these people with no material abundance. The result shows that about 70% participants do not get the material abundance in their growth. Only the rest of the participant get material abundance in their growth. As a result, the measurement shows actually majority of girls did not get the material abundance.

Also, the questionnaire tests the extent of wealth have a influence in their childhood. It asks from two parts, sense and reality. Each question the author gives five level. For the question ask the sense, the choices are very unimportant, not very important, ordinary, important and very important. The most people think the wealth is important, which involves about 44% of participants. The second most choice is the ordinary, about 30% participant choose it. The rest of them is very important, not very important and very unimportant. These three corresponding to 15.71%, 8.57% and 1.43%. For the reality part, the choices are completely satisfied, less satisfied, ordinary, easier to satisfy and fully satisfy. The most common option is the easier to satisfy, about half of the participant choose it. The rest of choice from high to low is ordinary, fully satisfied, less satisfied and completely satisfied. The percentage are 25.71%, 11.43%, 8.57% and 2.86%. As a consequence, the majority of girls think wealth is important to their life but not the most important. In reality, the majority of the girls are very easy to satisfied their wealthy level.

3.2. The Opinion of the Love View

In this part of the questionnaire, the point the author mainly focused on participants' perspective of definition of the love. For operational the love view, the author gives two point and lets the participants to contact. One is the wealth, the other is the emotions. There are 5 questions to ensure the position of participant. Before giving these 5 questions, here is a question that asks the participant whether have any love experience in their life. About 61% of the participants have at least one love experience. It means the data of love view part can more valid to show the position of the participant stand by. The type of the first question is multiple choices and it asks which value their partner should have. The choices are appearance, financial situation and the quality. Because the appearance is not the part focused on. Compared to financial situation and the quality, the quality get more support than financial situation which can express to 87.41% great than 68.57%. The second question is asked about definition of the love. The author gives three answer. One is the emotional link with each other represent the emotions, the other which is the material bring to each other represent the wealth. The additional choice for participants to fill their thought except the former answers. About 85% of the participants choose the emotional link with each other. Just 12.86% of the participants choose the material bring to each other. As a result, the love is more link with emotions in the participants' sense. The third question is inquired that between the material standard of living and love, which one is more important to your own happiness. The author gives four choices for participant to choose, love, material standard of living, both are important and both are not important. About 69% of the participant choose the both are important, 24.29% of the participant choose the material standard of living, 5.71% of the participants choose love and only 1.43% of the participants choose both are not important. Consequently, compare just love or material, get both are closer to the thought of participants toward happiness. But just compare these two, the material is more to the thought of participants to ward happiness. The fourth question is in the future life, what's your most expectation? The choices are higher quality of the material life, stable love relationship, both are expected, both

are not expected. Most of the participants chose both are expected which takes 60% of the participants. Between the high quality of the material life and stable love experience. A stable love relationship gets more support. It can be explained that 25,71% is greater than 10%. Moreover, just 3 participants chose that both were not expected. In conclusion, the participant is more expected for both material and love or just have love. Here is the final question, it asks for which quality is more likely to stabilize the love relationship. The choices are fidelity, passion, commitment, economics, responsibility, family atmosphere, and extra blank for additional answers. This is a multiple-choice question. The most focused part here is the economics which represent the wealth. From the highest support to the lowest, it can express to fidelity, responsibility, economics, family atmosphere, commitment and passion. They can correspond to 90%, 88.57%, 75.71%, 70%, 65.71% and 52.86%. For economics, it has 75.71% of the participants choose it. Compared to other choices, this measurement not too high and not get too low. For a result, wealth is important to stable a love relationship, but not the necessarily.

To conclude the opinion of the love view, much participant think the love can be more important in a relationship, but based on the current situation, sometimes people may choose the wealth not the love.

3.3. The Relationship between the Love View and Material Abundance

Table 2. The data of the investigation of material abundance influence love view

Result	Love view	Data
Benefit	more easy to build a femininity and when they grow up they will be more confident to face anything	87.14%
	good for both the body and the mental health	78.57%
Drawback	easy let the girls to build a dependence personality	44.29%
	easy to build a bad habit which is spend money a lot	30%
Other ideas	none	3%

In the questionnaire, a few questions are asked for the opinion of the participant. One question is asked about the idea that is material abundance for girls is or not the mainstream culture nowadays. Because the family should give more resource to girls is a custom in China. The data give the point that about 67% of the participant think it is the mainstream culture nowadays. It means the traditional custom also have their effect these days. Next, here's a question to ask about the benefits and the drawbacks of the material abundance for girls. The choices involve two benefits, two drawbacks and NONE. For benefits, give the girls lots of material support may let them more easy to build a femininity and when they grow up they will be more confident to face anything. About 87% of the participant agree it (see Table 2). Another benefit is good for both the body and the mental health. About 79% of the participant agree it. For drawbacks, here's 44.29% of the participant agree that it is easy let the girls to build a dependence personality. Another drawback is easy to build a bad habit which is spend money a lot. 30% of the participant choose it. The least support is the choice NONE. Only about 3% of the participant choose it. For a conclusion, the participants think the benefit of the material abundance on girls are more than the disadvantages it brings. Moreover, author give out an open question let participant to give out their own idea. The question is 'Do you think if family begin to use lack of the material to nurture the girls, is any consequence will happen?' The most feedback tells the same thing which is it will cause the girls easy to be self-abasement. For this part, the main information that give us is main effect the material abundance bring to girls is confident. The last question is the influence between the material abundance and the girls' love view. The choice given is yes and no. Author gives out a blank of both answers to get more in-depth information from the participants. About 87% of the participants chose yes and most of them gave a similar idea which is more care about their partner's family financial situation and demanding of their partner. The rest of the participants give the point that love is no link with wealth. As a result, the influence between the

love view and material abundance is a real existence and material abundance can help girls to build their confidence.

4. Discussion

4.1. The Explanation of the Hypothesis

The hypothesis can be divided to four parts. First, from the result, the data shows that the majority of the girls do not get the material abundance. So the hypothesis that most girls get material abundance has failed. Next, the hypothesis that the majority of the girls are more focused on their partner's wealth when they look for their partner is partially wrong because the result shows that many participants think the love can be more important in a relationship, but based on the current situation, sometimes people may choose the wealth, not the love. Moreover, in the result, material abundance influences the love view focused on that the girls can be more care about their partner's family financial situation and demanding of their partner. The hypothesis linked with this resource is fully right. It causes more demands to her partner. The final hypothesis is to argue that the limitation of the material abundance of post-00s on girls are more than strength. Actually from the data, it shows that like the 'easier to build a femininity and when they grow up they will be more confident to face anything' these benefits get more support than the drawbacks and the other idea. It means the strength of the material abundance of post-00s on girls are more than the limitation, so this hypothesis was fully wrong.

4.2. Suggestion

From the result, it shows that material abundance on girls are important to avoid some disadvantages. For example, the girls may be self-abasement on a material deprivation environment. The self-abasement also may cause another bad effect to happen. Relay on the data, actually large amount of girls do not get material abundance in their real lives. So increasing the financial consumption on girls' growth is much more important now. But even though data shows that a large amount of girls do not get the material abundance in their real life, the increasing trend should be limited. Because the result set up the girls with the material abundance is hard to find a couple as they care more care about their partner's family financial situation and the demands of their couple. As a result, the money consumed by girls should be increased but its trend should be limited. Furthermore, the cultivation of the love view should get some change. Related to the article, the change should change in three parts, family, society and school [5]. In family, timely love education and sex education for female students is very necessary. In society, strengthening positive public opinion guidance, improve and eliminating the adverse impact of the social environment will be important. Finally, the school should strengthen ideological and political education for female students, have a love class and enrich campus culture construction. This work can help the female student to have a sense of the love and help them to gain success in their future life. For individual part, the female students should actively carry on self-learning and self-education, set up the goal of life.

5. Conclusion

For the conclusion, the material abundance brings more advantages than disadvantages, but it actually be factor that the malformation of the love relationship.

The limitation in this study involve different parts. The first part is the defining issue in the questionnaire as the questions to define material abundance and material deprivation are not enough accurate, so the validity of the data has been affected. For the chance in the future, the defining problem can be fixed by using another research method such like using the unstructured interview to get more in-depth information to show she experienced or not the material abundance. The next part is thought of the benefits and drawbacks caused by material abundance are limited. This question has certain directed to the participant. The fixation of it is use the unstructured interview to ask the

personal view of the participant. Using this information also can give researcher more sense of the study. The last limitation is the identity cannot be proved as the confidentiality be proved by anonymously. This research is focused on the female participant. So if someone wants review this study, the recommendation the author can give you is to use a female sample frame to do this research.
