Abstract. In recent years, with the exacerbation of societal aging, private eldercare institutions have assumed increasingly pivotal roles within our nation's eldercare service framework. Nevertheless, beneath the veneer of rapid development, the current state of service quality presents a less than satisfactory scenario. Within the realm of private eldercare institutions, numerous factors collectively influence the caliber of service. Foremost among these concerns is the issue of singular service offerings coupled with inconsistent quality. Many establishments lack rich and comprehensive service provisions in daily care, rehabilitative assistance, and psychological support, resulting in significant disparities in service standards. Moreover, inadequacies in staffing and professional capabilities serve as critical impediments to enhancing service quality. Numerous private eldercare institutions suffer from shortages in both the number and expertise of caregiving personnel, not only hampering the effective execution of daily services but also diminishing the satisfaction levels of service recipients to a certain extent. Furthermore, the issues of management systems and operational efficiency demand equal attention. Many institutions lack innovative and efficient mechanisms in management systems and operational models, leading to irrational resource allocations, inefficient service processes, thereby compromising overall service quality. Against the backdrop of these aforementioned challenges, the comprehensive enhancement of service quality in private eldercare institutions emerges as an urgent issue in need of resolution.

Keywords: Private aged-care institutions; Service quality; Analysis of the current situation; Thoughts on improvement.

1. Introduction

In the face of the challenges posed by an aging society, the development of elderly care services has become a focal point of societal concern. Private elder care institutions, as a vital component therein, bear a direct correlation between the quality of their services and the quality of life experienced by the elderly. Presently, these private institutions encounter numerous issues across various domains such as service offerings and quality, staffing and professional competence, as well as management structure and operational efficiency. Regarding service offerings and quality, many private elder care institutions still predominantly provide rudimentary life care services, lacking in personalized and diversified offerings. This not only fails to meet the increasingly growing spiritual and cultural needs of the elderly but also undermines the overall competitiveness of these institutions. Concerning staffing and professional competence, a common issue pervading elder care institutions is the inadequacy of personnel and their lack of robust professional skills. Insufficient professional training for caregiving staff leads to challenges in meeting the diverse health needs of the elderly during actual service provision. As for management structure and operational efficiency, many private elder care institutions have yet to establish scientifically sound and efficient operational mechanisms. The decision-making processes at the managerial level often lack foresight and innovation, resulting in low operational efficiency that hinders the rational utilization of resources and the enhancement of service quality. Hence, it is imperative to propose effective strategies and measures to address the primary issues and challenges currently faced by private elder care institutions.
2. Analysis of the current situation of service quality in private elderly care institutions

2.1 Service programs and quality

Private elderly care institutions, as integral constituents of the societal elderly care service framework, draw widespread attention to the current status and quality of their services. Amidst the prevailing milieu, the diversification of services and enhancement of service quality stand as pivotal indicators assessing the capabilities of private eldercare institutions. A scrutiny of the present scenario reveals endeavors by these institutions towards diversifying service offerings to meet the burgeoning spiritual and physical needs of the elderly. These services encompass fundamental daily care, healthcare management, psychological counseling, and recreational activities. Despite a gradual expansion in service scope, the depth and quality of services remain wanting. On one hand, due to limitations in resource allocation, certain institutions exhibit limited capabilities in specialized medical services and personalized care, thereby struggling to meet the specific needs of the elderly. On the other hand, while the array of recreational activities may increase, they often lack innovation and relevance, failing to genuinely engage the interests and participation of the elderly. In terms of service quality, challenges confronting private eldercare institutions are equally formidable. Chief among these is the disparity in staff qualifications. The inadequacy in training and recruitment mechanisms for professional eldercare personnel results in disparities in professional skills and service attitudes among staff, thus affecting the overall quality of service. Furthermore, a low level of service standardization poses a critical issue. The absence of unified service standards and evaluation systems makes it challenging to effectively monitor and assess service quality, thereby impeding the elderly's service experience. In addressing the process of diversifying service offerings and enhancing service quality, private eldercare institutions encounter multiple challenges such as resource allocation, staff qualifications, and standardization system construction. This necessitates not only continuous exploration and efforts from the institutions themselves but also support and guidance from relevant policies, as well as collective attention and participation from various sectors of society. Despite the ongoing need for improvement in the current status and quality of services provided by private eldercare institutions, it is precisely within this realm of continuous exploration and endeavor that effective models catering to the needs of the elderly and pathways to quality improvement gradually emerge. In the future, with an increasing emphasis on the quality of services provided by private eldercare institutions and the ongoing drive for improvement and innovation, there is reason to believe that these institutions can offer more diversified, high-quality services to better meet the elderly's care needs.

2.2 Staffing and professional capacity

The peculiarity of the elderly care service industry lies in its direct focus on the most vulnerable and in need of care elderly population in society. Therefore, the professional competence and staffing arrangement of personnel become pivotal criteria for assessing the service quality of a retirement institution. Presently, many private retirement facilities are confronted with the dual challenges of a shortage of human resources and inadequate professional skills. On one hand, with the increasing demand for elderly care services in society, qualified and experienced caregivers have become exceedingly valuable. On the other hand, due to generally low levels of remuneration in the elderly care service sector, it is difficult to attract a sufficient number of professionals, exacerbating the phenomenon of talent scarcity. In terms of professional capabilities, although many privately-run retirement institutions strive to enhance staff expertise through internal training, such efforts often prove insufficient in the face of the increasingly diverse and complex health needs of the elderly. The elderly require not only basic life care but also targeted medical treatment and psychological solace, necessitating caregivers to possess solid medical nursing knowledge as well as psychological counseling abilities. More crucially, high-quality elderly care services demand not only an adequate number of staff but also staff capable of providing personalized, meticulous care [1]. However, many
current private retirement facilities suffer from understaffing issues, with employees burdened excessively, rendering them unable to meet the elderly's demand for high-quality living. In such circumstances, even staff possessing professional skills find it challenging to exert their expected service efficiency. Furthermore, private retirement facilities often lack long-term planning in staff allocation. Insufficient training and career development path planning for personnel lead to high employee turnover rates, further exacerbating the instability of human resources. This instability not only affects service quality but also undermines the trust and reliance of the elderly on retirement institutions.

2.3 Management system and operational efficiency

In delving into the analysis of the service quality of privately-run elderly care institutions, a crucial factor that must be addressed is the management system and operational efficiency. The management system and operational efficiency directly impact whether these care institutions can provide high-quality services, thereby influencing the quality of life for the elderly. Presently, privately-run elderly care institutions face numerous challenges. Among them, the apparent weakness in management systems is a significant issue that cannot be ignored. Many privately-run elderly care institutions lack mature and systematic management models. They may encounter issues in recruitment, training, and retaining care staff, which directly affects the coherence and quality of services. Furthermore, the lack of professional knowledge and experience at the management level also hinders the enhancement of service quality.

From the perspective of operational efficiency, the resource allocation of many privately-run elderly care institutions is not rational. For instance, the utilization efficiency of funds might be low, with excessive allocation to non-core service areas, neglecting direct investment in the daily lives and medical care of the elderly [2]. Additionally, some institutions have low levels of informatization, lacking effective information management systems to optimize operational processes, which to some extent, constrains the improvement of service quality. Despite facing numerous challenges, some privately-run elderly care institutions have made positive progress in management and operations. They have gradually enhanced service efficiency and quality by introducing advanced management concepts and technologies. For example, some institutions have improved efficiency and accuracy in information processing by implementing electronic health record systems, thereby enhancing service quality. However, overall, there is still considerable room for improvement in the management systems and operational efficiency of privately-run elderly care institutions. The lack of systematic and professional management systems and operational models is one of the main factors hindering the improvement of service quality. To genuinely enhance service quality, it is imperative to fundamentally strengthen the construction of institutional management systems, optimize resource allocation, and improve operational efficiency to better meet the living and health needs of the elderly.

3. Main problems and challenges

3.1 Single service program and uneven service quality

In the burgeoning market of elderly care services, the inadequacies of private eldercare institutions in meeting the diverse needs of the elderly are not only highlighted but also reveal the frailties in quality control within the industry. The singular focus of service offerings is primarily manifested in the fact that the majority of private eldercare institutions still linger at the level of providing basic life care, such as dining services and basic medical care, while exploration and implementation in areas like spiritual and cultural needs and personalized services are relatively lacking. This status quo further widens the gap between the expectations of the elderly regarding eldercare services and the reality. With the progress of society and the improvement of people's living standards, the life needs of the elderly have far exceeded basic life care; what they yearn for is a more colorful and personalized "second life." Meanwhile, the uneven quality of service is another prominent issue. Due to the lack of unified service standards and quality supervision, there is a significant disparity in service levels among private eldercare institutions. Some institutions are able to provide a higher level of service,
while more institutions struggle to ensure service quality due to constraints in resources and poor management. This inconsistency in quality not only impacts the daily life experience of the elderly but also, to a certain extent, undermines the overall confidence of the public in private eldercare services.

3.2 Inadequate staffing and professional capacity

In the thorough exploration of various aspects concerning the current state of service quality in private elderly care institutions, inadequacies in personnel allocation and professional capabilities emerge as a particularly prominent challenge. This issue not only directly impacts the quality and efficiency of services but also has the potential to exert long-term negative effects on the physical and mental well-being of the elderly. Foremost among these challenges is the pervasive shortage of professional nursing staff faced by elderly care institutions. Associated closely with elderly care services is not only the provision of daily life assistance but also the professional care for the physical and psychological well-being of the elderly. However, the reality is that many institutions struggle to recruit professionals with the necessary medical and psychological counseling capabilities. This shortfall implies that when confronted with the complex health issues of the elderly, institutions often find themselves unable to provide comprehensive and meticulous services. Furthermore, even among the hired staff, there is considerable disparity in their professional competence and service quality. Insufficient training has become a universally acknowledged issue. In the rapidly evolving eldercare industry, providing continuous professional training for employees not only enhances service quality but also is critical for enhancing institutional competitiveness. However, due to cost considerations or managerial oversights, this aspect is often neglected. As a result, even well-intentioned staff members may find themselves unable to fulfill their roles effectively due to lack of effective guidance and training. It is worth mentioning that with the development of society and advancements in technology, the needs of the elderly for eldercare services are no longer limited to basic life assistance but increasingly encompass the pursuit of quality living. This necessitates that service personnel in eldercare institutions possess not only basic nursing skills but also certain cultural literacy and psychological counseling abilities to meet the diverse spiritual and cultural needs of the elderly [3]. Regrettably, many current private elderly care institutions still fall short in this regard, unable to fully meet the higher-level needs of the elderly. Overall, the insufficient allocation of personnel and the uneven development of professional capabilities constitute significant challenges for private elderly care institutions in enhancing service quality. This not only concerns the quality of life of the elderly but also influences the overall societal understanding and attitude towards eldercare issues. Addressing this issue requires the concerted attention and efforts of various sectors of society, aiming to provide the elderly with more professional, meticulous, and humane services, thus making their later years more fulfilling.

3.3 Inefficient management and operation

Private elderly care institutions are assuming increasingly pivotal roles within the societal eldercare framework. As the challenge of population aging intensifies, the quality of services provided by these institutions becomes directly correlated with the elderly's quality of life. However, suboptimal management and operational efficiency have emerged as significant impediments to the advancement of private elderly care institutions. On the managerial front, many of these institutions suffer from a dearth of proficient management teams and mature managerial experience. Often operated by investors or entrepreneurs driven by enthusiasm for the eldercare industry, they may lack requisite industry knowledge and managerial finesse. Consequently, myriad issues arise in day-to-day operations, including inadequate staff training, inconsistent service standards, and deficient internal communication mechanisms. These challenges not only undermine service coherence and professionalism but also dampen employee morale. Conversely, low operational efficiency poses another prominent issue. Due to the absence of efficient information management systems and modernized management tools, numerous private elderly care institutions still rely on traditional
paper-based records and manual operations, significantly diminishing work efficiency and data accuracy. Regarding resource allocation, the absence of meticulous management makes it challenging to achieve optimal resource allocation, leading to resource wastage and unstable service quality. More critically, with the escalation of market competition, some institutions, in pursuit of short-term gains, overlook long-term service quality and institutional sustainability, exacerbating the difficulties in management and operations. Such myopic behaviors not only harm the interests of the elderly but also tarnish the image and reputation of private elderly care institutions within society. Confronted with these challenges, private elderly care institutions must earnestly contemplate how to enhance management and operational efficiency while ensuring service quality. This involves attracting and nurturing professional talents, introducing modern management tools and technologies, and establishing and refining internal management mechanisms, among various facets. Although this constitutes a complex process requiring time and sustained effort, only by addressing these fundamental issues can private elderly care institutions fortify their position amidst fierce market competition and deliver superior, more professional services to the elderly.

4. Reflections and measures to improve the service quality of private elderly care institutions

4.1 Service programs and quality improvement strategies

In the journey of enhancing the quality of services in private elderly care institutions, the service offerings and strategies for improvement unquestionably stand as pivotal. This realm presents challenges and opportunities in tandem, necessitating not only a profound analysis of current issues but also a forward-looking approach to innovate service models and management methods. When delving into service offerings, it's imperative to acknowledge that elderly care extends beyond mere provision of basic life sustenance; it should encompass spiritual solace, health management, education, and entertainment, among other multidimensional services. High-quality elderly care should be comprehensive and meticulous, catering to the diverse needs of the elderly. For instance, by introducing personalized health management plans coupled with the monitoring of health data through wearable smart devices, one can better attend to each elderly individual's health status. Similarly, diversifying educational and recreational activities not only enriches the elderly's spiritual life but also enhances their satisfaction and happiness. Regarding strategies for quality improvement, emphasis on talent cultivation and technological applications is indispensable. Outstanding elderly care personnel form the cornerstone of service quality enhancement. Hence, increasing the intensity of training and education for elderly care personnel should not only enhance their professional skills but also elevate their service consciousness and empathy, enabling them to genuinely empathize with the elderly and provide more considerate and meticulous service. Meanwhile, actively exploring the application of technology in elderly care services, such as enhancing management efficiency through intelligent systems and utilizing telemedicine services to improve the professionalism of health management, are effective means to promote quality improvement [4]. Furthermore, establishing a sound quality assessment system is also an essential aspect not to be overlooked in ensuring service quality. Regular quality assessments enable timely identification of problems and deficiencies in services, facilitating swift adjustments and optimization of service strategies. Introducing third-party assessment agencies for objective evaluation can effectively ensure the impartiality and authority of assessments. In the process of enhancing service offerings and quality, due consideration should also be given to the roles of families and society. Encouraging family members to participate in the elderly's care not only enhances the elderly's sense of well-being but also fosters communication and collaboration between elderly care institutions and families, fostering a healthy ecosystem for elderly care services. Simultaneously, effectively connecting with community resources to provide a more diverse range of services for the elderly is also a crucial avenue for improving service quality. In conclusion, enhancing the quality of services in private elderly care institutions is a systemic endeavor that requires multifaceted efforts and innovations. Through continuous optimization of service
offerings, deepening talent cultivation and technological applications, establishing a robust quality assessment system, and fully leveraging the roles of families and society, comprehensive enhancement of elderly care service quality can be effectively promoted.

4.2 Optimization of human resources and capacity enhancement

High-quality service begins with excellent personnel, as the caliber and skills of individuals directly determine whether a nursing institution can provide a warm and professional care environment for the elderly. Therefore, a thorough analysis and implementation of effective human resources strategies are of paramount significance in enhancing service quality and establishing a harmonious elderly care environment. In the field of human resources management, for nursing institutions, the primary task is to attract and retain employees who possess both empathy and professional skills. This requires not only offering competitive compensation systems but also establishing a culture that emphasizes both incentive and growth. Through regular training and education, continuously enhancing employees' professional abilities and service standards can effectively ignite their enthusiasm and sense of belonging. Cultivating empathy and emotional involvement among staff is particularly crucial for enhancing the quality of elderly care services. Elderly care differs from conventional service industries in that it demands service providers to understand and empathize with the needs and emotions of the elderly, thereby providing more intimate and meticulous care. Therefore, nursing institutions should prioritize emotional education and psychological health training to help employees better establish emotional connections with the elderly and enhance the warmth of service. On the other hand, encouraging innovation and adopting technological means are also effective ways to improve the quality of human resources. With the advancement of technology, many advanced technologies can be applied to elderly care services, such as smart wearable devices and remote health monitoring, which not only improve the efficiency and accuracy of services but also provide more security for the elderly. Nursing institutions should actively cultivate employees' ability to apply technology, enabling them to flexibly utilize these tools to empower humanistic care with technology. To achieve this goal, nursing institutions need to create an environment of continuous learning and innovation, encouraging employees to explore and try new service methods and technological applications. At the same time, by establishing effective feedback and incentive mechanisms, employees can continuously learn and grow in practice, forming a positive, progressive team culture.

4.3 Strengthening internal management and improving operational efficiency

In the discourse concerning the enhancement of service quality in private elderly care institutions, strengthening internal management and augmenting operational efficiency undoubtedly constitute pivotal facets. This subject matter transcends mere managerial discourse, intertwining with a broad spectrum of social responsibility, economic viability, and humanitarian consideration. Within this realm, several aspects merit profound analysis. Foremost among these is the optimization of management processes through technological means. With the rapid evolution of information technology, digitized management systems have emerged as vital tools for enhancing managerial efficiency. For instance, establishing a comprehensive resident health information system facilitates real-time monitoring and management of residents' health status, thereby effectively preventing the onset and progression of diseases. Moreover, leveraging big data analytics to optimize resource allocation, such as rational deployment of nursing personnel and devising more precise dietary plans, not only enhances service quality but also substantially boosts operational efficiency of institutions. Subsequently, intensifying staff training and elevating professional demeanor constitute indispensable components of enhancing service quality. In the elderly care service industry, employees' proficiency and service attitude directly correlate with service quality. Therefore, institutions should regularly conduct professional training, aimed not only at enhancing employees' nursing skills but more importantly at reinforcing their professional ethics and service consciousness. In this regard, drawing insights from exemplary elderly care service models both domestically and
internationally, such as adopting Japan's "person-centered" service philosophy, and employing methods like case studies and role-playing, enables employees to genuinely comprehend and implement the principle of placing the elderly at the core of service provision. Additionally, establishing a robust internal evaluation and incentive mechanism is pivotal in promoting managerial enhancement. By instituting clear service quality standards and conducting regular service evaluations, institutions can promptly identify and address existing issues. Furthermore, by commending outstanding employees and teams, they can stimulate the enthusiasm and innovation of all staff members. Simultaneously, establishing an effective complaint handling mechanism ensures that the opinions of the elderly and their families are promptly heard and addressed, not only contributing to enhancing service quality but also serving as an effective means of bolstering institutional reputation. On this foundation, strengthening alignment and collaboration with social resources also represents an effective avenue for enhancing service quality. Elderly care services cannot be comprehensively addressed by isolated institutional efforts alone but necessitate the collective involvement of various sectors of society. By forging partnerships with medical institutions, voluntary organizations, educational institutions, and other social resources, institutions can not only broaden their service scope to meet the diverse needs of the elderly but also elevate service professionalism and humanitarian care through societal engagement [5].

5. Conclusion

Upon observing the current state of service quality in privately-run elderly care institutions, it's evident that the challenges and issues they face are significant. However, this also presents an opportunity for reform and innovation within the elderly care service industry. Achieving a fundamental enhancement in service quality necessitates a multi-faceted approach, encompassing diversification of service offerings, optimization of human resources, and bolstering internal management and operational efficiency. Regarding service offerings and quality, proactive exploration of diversified and personalized service models is imperative to meet the elderly's needs, not only on a material level but also addressing their spiritual well-being. This not only enhances the elderly's quality of life but also elevates the institution's service standards and competitive edge in the market. In terms of human resources, apart from increasing investment and augmenting the number of caregivers, it is paramount to intensify professional training and skill enhancement for personnel. By establishing a robust training system and enhancing caregivers' professional competence, we can better meet the elderly's healthcare needs. As for internal management and operational efficiency, institutions need to innovate in management models, such as leveraging modern information technology to enhance management efficiency, optimize resource allocation, and improve the efficiency and quality of service processes. In summary, addressing the enhancement of service quality in privately-run elderly care institutions requires comprehensive consideration and concerted efforts, aiming to provide the elderly with superior and efficient services while contributing to the healthy development of China's elderly care service industry.
