Abstract. Hebei province has implemented an ambitious optimization strategy to enhance its industrial landscape and promote sustainable economic growth. This paper examined the multifaceted approach adopted by Hebei province, focusing on high-tech integration, innovation, and addressing talent challenges. The foundation of Hebei’s strategy lies in transforming traditional industries, directing them towards high-value sectors such as new energy and intelligent manufacturing. This strategic pivot aligned with global trends and emphasized environmental preservation through a green, low-carbon economy. However, a pressing challenge surfaced in the form of high-tech talent scarcity. To address this obstacle, the paper introduced numerous suggestions. This research underscored the significance of region-specific strategies for driving industrial transformation. It contributed to the broader discourse on achieving balanced and sustainable economic development, highlighting the importance of nurturing a skilled workforce that can adapt to the demands of a rapidly evolving technological era. As Hebei Province advanced its optimization strategy, continued dedication to talent development and seamless integration of high-tech advancements would be pivotal in ensuring successful policy execution. This study encapsulated the essence of Hebei’s journey toward economic revitalization, emphasizing the need for forward-looking strategies that harmonized economic growth and environmental consciousness.

Keywords: Industrial optimization strategy, high-tech integration, innovation.

1. Introduction

Hebei province, known for its traditional steel, ceramics, and cement industries, is a testament to China’s industrial prowess. However, the province faces a pressing challenge - the coexistence of its industrial legacy with the urgent need for sustainable development. The existing research on industrial optimization in Hebei Province primarily delves into several aspects. Regional Collaboration is a prominent focus, particularly concerning the coordinated development within the Beijing-Tianjin-Hebei region. Additionally, Infrastructure Development and Market Expansion are critical facets of the investigation. Some studies suggest that the transfer of rural surplus labor force and the development of the tertiary industry are crucial factors influencing the level and efficiency of industrial structure in Hebei Province. However, there is a limited discussion in the existing literature regarding R&D and Industry-Academia Collaboration, as well as Government Regulatory Capacity. This paper aims to fill these gaps to the best of its ability. This study delved into Hebei’s intricate industrial landscape to bridge the gap between economic growth and environmental equilibrium. The research examined the multifaceted approach adopted by Hebei province, focusing on high-tech integration, innovation, and addressing talent challenges. The foundation of Hebei’s strategy lies in transforming traditional industries, directing them towards high-value sectors such as new energy and intelligent manufacturing. This strategic pivot aligned with global trends and emphasizes environmental preservation through a green, low-carbon economy. However, a pressing challenge surfaced in the form of high-tech talent scarcity. To address this obstacle, the paper introduced numerous suggestions. This research underscored the significance of region-specific strategies for driving industrial transformation. It contributed to the broader discourse on achieving balanced and sustainable economic development, highlighting the importance of nurturing a skilled workforce that can adapt to the demands of a rapidly evolving technological era. As Hebei province advances its optimization strategy, continued dedication to talent development and seamless integration of high-tech advancements will be pivotal in ensuring successful policy execution. This study encapsulated
the essence of Hebei’s journey toward economic revitalization, emphasizing the need for forward-looking strategies that harmonized economic growth and environmental consciousness.

2. Optimization Strategy for Industries in Hebei Province

Hebei province, a notable region within China, has undertaken proactive efforts to propel the refinement and elevation of its industrial framework, all aimed at augmenting the efficiency of its economic progression. The province's overarching blueprint for industrial enhancement encompasses a multifaceted approach, encompassing several critical facets. Central to this strategy is the transformation and elevation of traditional industries, underlined by a resolute commitment to nurturing high-tech and high-value-added sectors, which are pivotal in ensuring sustained economic expansion. Moreover, Hebei province has made it a steadfast mission to bolster its innovation prowess, cultivating an environment conducive to the emergence of competitive high-tech enterprises and fostering the growth of industrial clusters. Simultaneously, the province is dedicated to seamlessly integrating technological innovations across diverse industries. This strategic alignment with technological advancements propels industrial growth and bolsters the economic landscape. A focal point of Hebei’s agenda is cultivating strategically emerging industries, including new energy, materials, biopharmaceuticals, and intelligent manufacturing. By harnessing the potential of these sectors, it can amplify its industrial prowess on the global stage. In recent years, global warming and other climate change problems caused by excessive greenhouse gas emissions have become increasingly severe and the focus of international attention. However, surfeit CO2 emissions are the arch-criminal to the enhanced greenhouse effect [1]. Notably, Hebei province values environmental conservation as paramount, championing a development model predicated on green practices, low-carbon methodologies, and circular economy principles.

This synergistic approach coordinated economic expansion with ecological preservation, fostering an equilibrium pivotal for sustainable progress. A distinctive attribute of Hebei’s strategy lies in its adept amalgamation of various regions' unique qualities and strengths. This coordinated approach fuels complementary development and equilibrium within the province's industrial fabric. The region's emphasis on talent cultivation is another cornerstone, as it endeavors to attract and nurture a cadre of high professionals, serving as the backbone of its industrial advancement. Hebei province actively participates in international collaborations as a testament to its global outlook. Through initiatives such as seeking foreign investment, transferring cutting-edge technologies, and incorporating advanced management expertise, the province of Hebei expands its perspective on industrial development, harnessing global insights for local advancement. In 2015 alone, Hebei Province approved 131 outbound investment enterprises, marking an 8.3% year-on-year growth. Foreign direct investment also surged, reaching 306 million USD, showcasing an 80.8% increase. The province's robust growth in outward cooperation investments is further demonstrated through its increasingly close economic collaboration with countries along the "Belt and Road" initiative. In 2016, Hebei Province's overseas direct investment reached 335 million USD, indicating a 42.6% year-on-year increase. Within this, newly signed contracts for foreign contracted projects amounted to 4.67 billion USD, exhibiting a 20.9% year-on-year growth [2].

The evolution towards a modern industrial system carries profound significance for Hebei’s populace. This transformation kindles an entrepreneurial spirit and innovation, fostering an environment ripe for growth and the optimization of industries. Underpinning this modernization drive is the imperative to construct a contemporary industrial design, a pivotal factor in enhancing competitiveness. This alignment with the trends of globalization and the shift towards knowledge-driven progress augments Hebei's standing on the global stage. The intricacies of industrial structure optimization are tightly interwoven with economic strata and competitive positioning. A judicious arrangement within this framework serves as a countermeasure against adverse repercussions, standing as a pivotal driver for fostering sustained economic expansion. Hebei's multifaceted
approach to industrial optimization paints a comprehensive picture of strategic foresight, setting a trajectory for balanced growth, innovation, and global integration.

2.1. Introduction to Industrial Optimization Policies

The impetus driving Hebei's pursuit of industrial optimization is deeply rooted in a national imperative for industrial transformation. This drive towards low-carbon production directly responds to global climate challenges and the urgent need to combat environmental degradation. Given Hebei's prominent industrial status, the region confronts a complex amalgamation of pollution, resource depletion, and energy consumption challenges. In a strategic response, the provincial administration has meticulously formulated various policies to facilitate the seamless adoption of sustainable and efficient industrial models. The trajectory of Hebei's journey towards industrial optimization is significantly energized by the resonating call at the national level, where the paramount importance of low-carbon production in mitigating environmental impacts is underscored. This catalytic impetus has prompted Hebei province to proactively introduce various policy interventions, catalyzing its industrial landscape's profound reconfiguration and transformation. Foremost among these strategies is the strategic recalibration of traditional industries, such as steel production, where measures like temporary production suspensions and controlled output have been judiciously implemented. These measures have effectively curbed emissions and alleviated the strain on resources, thus orchestrating a harmonization of the industrial fabric with heightened sensitivity to ecological concerns.

Furthermore, the province has fervently advocated for the augmentation of the tertiary sector, with a specific emphasis on the burgeoning service industry and the emerging digital domain. Inherently eco-friendly, these sectors naturally generate reduced ecological footprints while simultaneously catalyzing new avenues for employment. By nurturing these sectors, the author believes that Hebei province will achieve a double victory: promoting economic development and firmly maintaining ecological balance.

2.1.1. Emphasizing human capital accumulation and optimizing talent development modes

The strategic emphasis on human capital accumulation and optimizing talent development modes have particular significance in Hebei's endeavor towards industrial optimization, as they serve as cornerstones in the region's transition towards higher-value industries and innovation-driven progress. In addressing the issue of talent outflow, Hebei Province, considering the coordinated development of the Beijing-Tianjin-Hebei region, has gradually embraced models from these cities. By adhering to innovation and actively collaborating with Beijing and Tianjin, Hebei aims to stem the tide of talent migration. The provision of scholarships, research grants, and incentives underscores the province's commitment to attracting and retaining exceptional individuals in the technology domain. Collaborative engagements with both domestic and international universities further enhance the reservoir of expertise. Fundamentally, the strategic enhancement of human capital and the optimization of talent development bolster Hebei's capacity for industrial optimization. Harnessing the potential of its human resources and leveraging symbiotic relationships with economically potent neighboring regions, Hebei can integrate its aspirations for sustainable growth and ecological consciousness into its industrial structure.

2.1.2. Enhancing innovation through R&D and industry-academia collaboration

Improving the overall efficiency of the innovation chain is an essential goal for my country to improve the new nationwide system and fight the critical core technology battle. Adhering to the innovation-driven strategy, scientific and technological innovation capabilities are essential for strengthening the country's strategic scientific and technical strength. Based on the reality of its development, Hebei Province aims to improve the ability and level of innovation and growth and assists the province in making great strides toward significant scientific and technological innovation province from a policy perspective. Establishing and improving the scientific and technical innovation system and promoting scientific and technological innovation is necessary. The policy mechanism is upgraded [3].
In recent years, Hebei province has taken substantial leaps forward in enhancing its technological innovation capabilities, forming a robust bedrock to actualize its innovation-driven developmental strategy. A pivotal facet of this advancement lies in the heightened emphasis on Research and Development (R&D) investment. This heightened stress vividly mirrors the province's steadfast commitment to bolstering its scientific and technological progress. Simultaneously, Hebei province emphasizes industry-academia collaboration, a driving force that underpins innovation. The area catalyzes the transformation of scholarly research into tangible applications by fostering an interactive environment that bridges industries, universities, and research establishments. Despite a relatively weaker economic foundation, Hebei’s industrial development has been influenced by the growth engines of Beijing and Tianjin. Notably, advancements in high-tech industries have achieved specific successes, leading to an expansion in industry scale. However, the province predominantly occupies a position at the lower end of the industrial value chain, marked by comparatively modest profit margins. Furthermore, the demand for technological innovation is pronounced in Hebei’s industrial transformation and upgrade efforts. As such, the region has substantial potential for developing high-tech industries [4].

2.1.3. Enhancing government regulatory capacity to facilitate industrial structure optimization and upgrading

Under the condition of the socialist market economy, on the other hand, the market should fully function; on the other hand, the government should be wholly involved in the adjustment of the macroeconomy. Theoretically, the "Deficiency of the Market" and the "Deficiency of Government" have sense; the market or plan is not almighty. But the extreme conclusion derived from the two opposite views is one-sided. The "Deficiency of Market" believes the market system is unreliable. The economic development of one country can be achieved only if it draws support from the interference and adjustment of government; on the other hand, the government is more reliable than the market. The Deficiency of Government holds the view that government control is unreliable. Only if the market adjusts the distribution of resources the efficient development of the economy can be realized; in other words, the market is more reliable than the government [5].

The meaning of industrial transformation and upgrading is the process of industrial structure from simple to complex and from low to high level. The sector's growth must be modernized for the economy and society to achieve qualitative development and for the industry to be competitive. This process must be realized using technology, management, politics, the market, and the workforce. With the government's leadership and the macro-management level's support, industrial development's modernization, technological improvement, and innovation can exist. Therefore, the government's role in industrial transformation and upgrading is crucial [6].

2.1.4. Xiong’an New Area

The optimization of Hebei's industrial structure stands as a pivotal driver for sustainable economic growth. Diversifying Hebei's industries is crucial in reducing dependency on traditional sectors and propelling emerging ones. This transition is essential for achieving balanced and sustainable economic development. Hebei province has demonstrated its commitment by nurturing advanced manufacturing, high-tech industries, and modern services. Creating an environment conducive to high-tech industry development is central to Hebei's strategy. The province embraces innovation-driven growth by attracting targeted investments and leveraging policy incentives. This strategy fosters job creation and catalyzes innovation, elevating the province's technological prowess.

Furthermore, the benefits of optimizing the industrial structure reverberate throughout the economy. For instance, investments in advanced manufacturing and technological innovation cultivate a skilled workforce, reinforcing local talent retention and enriching the educational and research ecosystem. Hebei's dedication to environmental sustainability is intricately linked to industrial optimization. The province prioritizes eco-friendly industries, aligning economic growth with environmental preservation. This approach enhances residents' quality of life and positions Hebei as a responsible contributor to global sustainability efforts.
On April 1, 2017, the Communist Party of China Central Committee and the State Council issued a notice, deciding to establish the Xiong’an New Area in Hebei province. General Secretary Xi Jinping emphasized that the Xiong’an New Area should firmly develop and implement the new development concept, adapt to and lead the new normal of economic development, and construct a green, ecological, livable new urban area, a leading area for innovation-driven development, a demonstration area for coordinated action, and a pioneering area for open development. The goal is to create an innovative demonstration area that embodies the new development concept [7]. The imperative to enhance Xiong’an New Area's economic foundation aligns with its focus on industrial transformation. Guided by the national directive to create catalysts for innovative products and prototype regions for progress, Xiong’an New Area strategically employs innovation to nurture creative industries. This concerted effort accelerates the transition to higher-value industries and innovation-driven growth.

Furthermore, Xiong’an New Area's commitment to human capital, knowledge technology, and data information contributes to its development. Investments in education augment workforce skills, while core technologies in high-tech sectors solidify its global value chain position. The theoretical examination explores Xiong’an New Area's spatial development through economic wisdom, emphasizing alignment with developmental paradigms. Xiong’an New Area's strategic outlook pragmatically demands continuous refinement, adopting innovative policies for long-term spatial planning and construction.

2.2. The Current Status After Policy Implementation

With the advancement of the construction of innovative cities in Hebei province, the total number of scientific and technological talents in our area has continued to grow, the structure has been significantly optimized, and the quality has been continuously improved, which directly promoted the progress of the province's scientific and technological level and the improvement of regional innovation capabilities. Following the implementation of the policy "Emphasizing Human Capital Accumulation and Optimizing Talent Development Modes," the impact on high-tech industries in Hebei Province is notable. The period from 2011 to 2015 saw a steady rise in the average number of employees, culminating in a peak of 213,006 individuals in 2015. This positive trajectory reflects an improvement in the province's human resources, a trend aligned with the execution of the Beijing-Tianjin-Hebei coordinated development strategy in 2014. However, post-2016, the region witnessed a decline in the average number of employees within its high-tech industries due to the allure of talent towards more developed areas like Beijing, Tianjin, and the southeastern regions.

Nevertheless, by 2020, the average number of employees rebounded, reaching 200,786 individuals. This nuanced shift underscores the intricate interplay between local talent dynamics and economic strategies in Hebei Province. Due to the implementation of innovation development policies and increased investments in research and development (R&D), 2020 witnessed the emergence of 745 high-tech enterprises in Hebei province. However, the variations in their primary business revenue and total profits were relatively marginal, underscoring a prevailing pattern of gradual growth in the region [8].

Implementing industrial optimization policies in Hebei province has led to significant achievements in specific sectors, particularly within the digital industries. However, within specific strategic emerging initiatives, Hebei's development quality still needs to improve, indicating substantial untapped potential for growth. In the wake of policy implementation, the high-tech industry grapples with challenges such as intricate technical demands and sluggish market dynamics. These factors could contribute to a gradual pace of development. The research and application of emerging technologies demand significant time and resource investment, making substantial breakthroughs within a short time frame challenging. Another underlying factor pertains to the fluidity of market demand. The trajectory of the high-tech industry is intricately tied to its alignment with shifting market needs. Fluctuating market demands introduce uncertainty into the high-tech sector's circuit, subsequently influencing the efficacy of implemented policies. While the execution of industrial optimization policies in Hebei province has demonstrated noteworthy accomplishments,
advancing the high-tech sector demands continuous dedication and a comprehensive grasp of the intricate elements influencing its progress. Exploring alternative strategies for adapting policies to the ever-changing landscape is imperative in tackling these challenges.

3. Potential Problems of Strategic Implementation

From 2009 to 2018, Hebei’s economic structure exhibited distinct characteristics. The proportion of the primary sector remained consistently above 10%, the secondary industry fluctuated between 40% and 55%, and the tertiary sector predominantly remained below 40%. It was only after 2015 that the tertiary industry reached the 40% mark, creating an evident "2-3-1" pattern. Enhancing technological investments in the primary sector is crucial, particularly in developing modern urban-agricultural practices exemplified by facility agriculture. The secondary sector should leverage its strengths by increasing investments in key industries to drive growth across the entire secondary sector. The tertiary sector must continue its vigorous development of modern services, striving to achieve an ecological transition within the service industry [9]. The story of the high-tech sector needs to be improved by talent scarcity. Although policies have actively encouraged talent cultivation and attraction, the high-tech domain demands individuals with a deep-seated technological background. Nurturing and accumulating such expertise necessitate a long-term commitment and investment.

Despite various policies implemented by Hebei province to attract and retain talent, the migration of populations to major city centers such as Beijing remains prevalent. ‘In the 2018 talent outflow survey, Hebei province ranked third with a striking talent outflow rate of 55.6%. Notably, there is a substantial loss of talent in critical technical positions, innovation research roles, and high-skilled knowledge-based positions. This phenomenon significantly challenges Hebei’s economic development and participation in the Beijing-Tianjin-Hebei region’s integrated development.[10] This demographic movement has resulted in a noticeable shortage of high-tech professionals within the province, exacerbating the talent gap. Consequently, Hebei province faces a scarcity of high-tech talent, posing significant challenges to the successful execution of industrial optimization policies.

The scarcity of such specialized talent can be attributed to the prevailing educational landscape within Hebei. A comprehensive evaluation of the academic environment exposes several areas of concern. The overall quality of education within the province is called into question, particularly its alignment with the demands of the high-tech industry. Graduates often need more practical skills and industry-specific knowledge for seamless integration into the rapidly evolving tech sector. This misalignment between education and industry requisites further contributes to the insufficiency of adequately trained high-tech professionals. The underlying issue revolves around the need for more skilled individuals equipped to meet the demands of the high-tech industry. This shortage is driven by demographic shifts and the prevailing education environment that inadequately prepares graduates with the skills demanded by the ever-evolving technological landscape. As a result, the province’s ambitions for technological advancement and innovation-driven growth face significant obstacles, potentially impeding the realization of desired outcomes outlined in the industrial optimization policies. Addressing these challenges necessitates a multifaceted approach. Firstly, proactive measures are required to curtail the outward flow of high-tech talent from the province. This may involve creating an environment conducive to professional growth, offering attractive incentives, and fostering research and development initiatives within Hebei. Secondly, a strategic overhaul of the education system is essential. This includes realigning curricula to match the dynamic demands of the high-tech industry, enhancing hands-on training, and forging stronger connections between academia and industry.

In conclusion, the high-tech talent shortage in Hebei province constitutes a significant impediment to the effective implementation of industrial optimization policies. In light of this, addressing the challenges posed by population outflow and an insufficient education landscape tailored to high-tech industry needs is paramount. A comprehensive approach is required to surmount these challenges, encompassing talent retention strategies and education reform efforts. This holistic approach will
ultimately pave the way for realizing the province's technological aspirations and policy objectives more effectively.

4. Suggestions

Amid the critical challenge of talent scarcity, especially within the high-tech sector, fostering innovative talent emerges as a pivotal solution. Addressing this gap demands a proactive and multifaceted approach by Hebei province to cultivate a robust pool of ingenious professionals. To this end, prioritizing the development of creative talents through comprehensive educational and training programs becomes a strategic imperative. Collaboration among educational institutions, research entities, and industries is paramount in establishing specialized high-tech education centers. These centers should be designed as hubs of excellence, offering tailored curricula encompassing advanced technological subjects, practical training, and immersive learning experiences. Such a holistic approach ensures that aspiring high-tech professionals acquire theoretical knowledge and hands-on skills directly applicable to real-world scenarios.

Furthermore, forging strategic partnerships with leading tech corporations and seasoned innovators is pivotal. These partnerships can pave the way for mentorship programs, internships, and joint projects, providing aspiring professionals with valuable exposure to industry trends and practices. The guidance of seasoned experts can significantly enhance emerging talents' practical skill sets and industry acumen, thereby reducing the gap between academic learning and industry requirements.

To ensure the sustainability of this initiative, continuous collaboration between educational institutions and industries is paramount. Regularly updating curricula to reflect the latest technological trends and industry demands will ensure that graduates are well-equipped to navigate the evolving high-tech landscape. The high-tech industry's rapid evolution necessitates an agile educational framework that can adapt to changing circumstances.

5. Conclusion

This research underscores the critical need to realign Hebei's industrial structure with economic expansion and environmental sustainability. Analyzing the current policy landscape, the study emphasizes policy synergy, innovation promotion, and skilled human resource development. Hebei's commitment to ecological preservation and low-carbon practices aligns with global green development trends. Achieving a balance between industrial growth and environmental protection requires collaboration among industries, policymakers, and educational institutions. The study enhances the discourse on sustainable industrial development through policy evaluation, gap identification, and strategic proposals. Hebei Province is at a pivotal juncture, poised to shape a harmonious and prosperous future through refined policies, international best practices, and integrated environmental considerations. The research advocates a comprehensive approach emphasizing innovation, talent nurturing, and ecological consciousness as pivotal to Hebei's industrial progress. While the ongoing journey toward optimizing the industrial structure demands continual dedication and adaptability, it's acknowledged that policy implementation could face various factors and stakeholders not fully covered here. Furthermore, interdisciplinary considerations are limited in this study, which primarily focuses on the economic aspect of industrial optimization, disregarding vital areas like environment and technology. Nonetheless, these gaps are anticipated to be addressed in the future. By enacting well-informed policy adjustments and proactive initiatives, Hebei can achieve a harmonious synthesis of economic growth and environmental sustainability, serving as a model for regions with similar challenges.
