Evaluation System of Traditional Virtues Education in Higher Education Institutions

Hao Wen

Graduate School of Education, Graduate University of Mongolia, Ulaanbaatar, 11000, Mongolia

Abstract: In the process of cultivating future professionals in the field of architecture, higher vocational colleges and universities of architecture have gradually recognised the indispensability of traditional virtue education. This education not only emphasises professional knowledge and skills, but also focuses on students' moral qualities, decision-making abilities, and social responsibility. This study aims to explore the current situation and challenges of traditional virtue education in higher education institutions of architecture and how to construct an effective evaluation system to measure and enhance the quality of this educational field. Through in-depth research and analysis, a series of optimisation strategies will be proposed, including strategies in terms of clarifying evaluation objectives and standards, introducing diversified evaluation methods, strengthening teacher training and support, establishing a mechanism for student participation and feedback, as well as promoting the integration of traditional virtues education with disciplines. These strategies will help higher vocational colleges and universities to better cultivate skilled construction professionals with comprehensive quality and social commitment, and make positive contributions to the high-quality development of the construction industry and the country in the new era.

Keywords: Construction Higher Vocational Colleges; Traditional Virtue Education; Evaluation System.

1. Introduction

Architecture higher vocational colleges play a crucial role in modern society, not only as the cradle of cultivating architectural professional and skilled talents, but also with the responsibility of shaping the future urban and social environment. However, in addition to imparting professional knowledge and skills, higher vocational colleges and universities are also tasked with the mission of cultivating students' moral character, social responsibility and fostering core values. Traditional virtue education is particularly important in this context, which not only focuses on students' technical achievements, but also on cultivating their moral values, social commitment and ethical decision-making abilities. The purpose of this paper is to explore the current situation and challenges of traditional virtue education in higher education institutions of architecture and how to construct an effective evaluation system to measure and enhance the quality of this educational field. Through in-depth research and analysis, a series of optimisation strategies will be proposed to help higher vocational colleges and universities better achieve their goals of traditional virtue education, cultivate architectural professionals with more ethical qualities and a sense of social responsibility, and make a positive contribution to the sustainable development of society [1].

2. The Relevant Overview of Traditional Virtue Education

2.1. The Concept and Importance of Traditional Virtue Education

Traditional virtue education is an educational concept and practice aimed at cultivating students' moral qualities, social responsibility, and good character and behaviour. This type of education emphasises the transmission and promotion of character, morals, ethics and social values. The core of traditional virtues education is to prepare students not only with professional knowledge and skills, but also with excellent moral qualities that can contribute positively to the well-being of society and human beings. The importance of traditional virtues education lies in the fact that it is not only about individual character cultivation, but also about the harmonious development of society. Through the inheritance and promotion of traditional virtues, higher vocational colleges and universities can cultivate more socially responsible and socially responsible professionals for the society [2]. These talents are not only equipped with industrial skills, but also able to adhere to the moral bottom line in their career, actively participate in social welfare activities, and contribute to the sustainable development of society. Traditional virtue education also helps to shape a positive campus culture, promote mutual trust and teamwork between teachers and students, and improve the reputation and social recognition of the school.

2.2. Implementation Status of Traditional Virtue Education in Higher Vocational Colleges and Universities

The implementation status of traditional virtue education in higher vocational colleges and universities presents diversity and complexity. On the one hand, many higher vocational colleges and universities have already realised the importance of traditional virtue education and are actively engaged in the design and implementation of related education. These schools may have formulated a series of moral education programmes, including curricula, social practice activities, moral lectures and so on, in order to cultivate students' moral concepts and behavioural norms. Some tertiary institutions have also established ethics committees or related organisations to oversee and promote the implementation of traditional virtues education. However, on the other hand, some higher vocational institutions still have challenges in traditional virtues education [3]. Some schools may have insufficient investment in this educational area and lack clear educational objectives and evaluation systems. Some schools
may find it difficult to conduct traditional virtues education effectively due to lack of educational resources or other factors. In addition, the evaluation of the effectiveness of traditional virtues education is a complex issue that requires the establishment of a scientific evaluation system to measure students' moral growth and behavioural changes.

3. Evaluation System Construction of Traditional Virtues Education

3.1. Core Values of Traditional Virtue Education

The core values of traditional virtue education are the first step in constructing the evaluation system. The values emphasised in traditional virtue education usually include honesty, integrity, respect, responsibility, fairness, compassion, courage and so on. These values are the cornerstones for developing students' character and morality, and help shape them into socially responsible people with an ethical conscience [4]. The construction of the evaluation system needs to clarify these core values and incorporate them into the educational objectives and evaluation criteria to ensure that educational activities are consistent with the core values.

3.2. Theoretical Framework for the Construction of Evaluation System

A scientific theoretical framework is needed to build the evaluation system of traditional virtue education in construction higher vocational colleges. This theoretical framework will help clarify the structure and process of the evaluation system and ensure its scientificity and effectiveness. In the context of construction higher vocational colleges and universities, the theoretical framework should comprehensively consider the characteristics of ethics, social responsibility and sustainable development in the field of construction. The theoretical framework can be constructed by drawing on theories and methods in the fields of educational assessment, architectural ethics, and social sciences to ensure the operability and sustainability of the evaluation system in traditional virtue education. This will help higher vocational colleges and universities to better measure and improve students' moral qualities and ethical behaviours in the field of construction, and to cultivate skilled construction professionals with a greater sense of social responsibility and good moral character.

3.3. Key Indicators and Elements of Traditional Virtues Education

The key indicators and elements of the evaluation system are the core of assessing the effectiveness of traditional virtue education. These indicators can include students' performance in terms of moral awareness, social responsibility, teamwork ability, ethical decision-making ability, and social participation. In addition, the impact of elements such as educational environment, teacher quality, and educational resources on traditional virtue education can also be considered [5]. By clarifying these key indicators and elements, the evaluation system can more accurately reflect the level of traditional virtue education in schools and provide a concrete basis for improvement.

3.4. Methods and Tools of the Evaluation System

The methods and tools of the evaluation system are key to ensuring the effectiveness of data collection and analysis. Various methods, including questionnaires, observations, interviews, case studies, etc., can be used to collect information on students' character and moral development. In addition, IT tools and data analysis techniques can be used to process and analyse large amounts of data to provide more comprehensive evaluation results. The selection of methods and tools for the evaluation system should be based on specific assessment objectives and the actual situation of the school to ensure that the evaluation is scientific and operable.

4. Advantages and Shortcomings of the Traditional Virtues Education Evaluation System

4.1. Advantages of Traditional Virtue Education Evaluation System

The traditional virtue education evaluation system has important advantages in construction higher vocational colleges and universities. Firstly, it emphasises the cultivation of comprehensive literacy. In the field of architecture, in addition to professional knowledge and skills, literacy in ethics, social responsibility and sustainability is equally critical. The evaluation system of traditional virtue education helps to cultivate students' overall comprehensive quality, so that they not only possess technical skills, but also ethical and moral concepts and social responsibility. Secondly, it helps to build a positive campus culture. In the construction field, teamwork and ethical decision-making are crucial to the success of a project. By emphasising ethical behaviour and social responsibility, the Traditional Virtues Education Evaluation System promotes a healthy campus culture and enhances mutual trust and teamwork between teachers and students, which is crucial to the development of construction professionals. In addition, it provides students with a competitive advantage for their career development. In the construction industry, integrity and ethical qualities are critical to professional success. Students educated in traditional virtues are usually more likely to have a certain sense of social responsibility and ethical decision-making ability, which makes them more competitive in their careers.

4.2. Shortcomings of the Evaluation System of Traditional Virtue Education

However, there are also some shortcomings in the evaluation system of traditional virtue education. Firstly, the evaluation is more subjective. Qualities such as ethics and social responsibility are often more difficult to measure by objective standards, and the subjective views and values of the evaluators may have an impact on the evaluation results, easily triggering unfairness and inconsistency in the evaluation. Secondly, the establishment and implementation of an evaluation system takes a lot of resources and time. Evaluation of traditional virtue education usually requires extensive data collection, interviews and observations, which will increase the workload and cost of schools, especially in terms of manpower and time. In addition, it is difficult to directly quantify the effects of the evaluation system. Unlike academic performance, the effectiveness of traditional virtue education is difficult to measure directly through digital
means, which poses a challenge for evaluation. How to accurately assess students' moral character and ethical behaviour remains a complex issue.

5. Challenges and Solutions to Implementing the Evaluation System

5.1. Clarifying Evaluation Objectives and Standards

In order to optimise the evaluation system of traditional virtue education in higher vocational colleges and universities of architecture, the first task is to clarify the evaluation objectives and standards. This means establishing clear educational objectives so that students' development in terms of moral character, social responsibility and ethical behaviour can be accurately assessed. Clear evaluation criteria will help schools better measure the effectiveness of traditional virtues education and provide a clear direction for improvement. For example, the development of students' sense of social responsibility is taken as the assessment objective. In order to quantify this objective, specific criteria can be developed, such as whether students take the initiative to participate in community service activities, perform well in academic integrity, and demonstrate leadership skills in teamwork. These criteria can be used to collect data through questionnaires, student self-evaluation, and teacher-student mutual evaluation, and then the data can be analysed to assess the level of students' social responsibility. By clarifying the evaluation objectives and standards, construction higher vocational colleges and universities can design evaluation tools and methods in a more targeted manner to ensure that the evaluation system can accurately reflect students' growth in traditional virtue education, thus providing a reliable basis for improving and enhancing the quality of education. At the same time, clear evaluation objectives also help to form a consensus between the school and its staff, students and parents, and improve the acceptance and effectiveness of the evaluation system.

5.2. Introducing Diversified Evaluation Methods

Traditional virtue education covers a number of dimensions such as ethics, social responsibility, moral decision-making ability, etc. Therefore, a single evaluation method often fails to fully reflect students' performance in these areas. The introduction of diversified assessment methods will help assess students' ethical and moral development in a more comprehensive and objective manner. In addition to traditional qualitative assessment methods such as interviews and observations, quantitative assessment methods such as questionnaires can be introduced. The questionnaires can be designed to address students' moral values, social participation and sense of integrity so that a large amount of data can be collected quickly and statistically analysed. This method can provide more objective information and help schools better understand the overall situation of students. In addition, the introduction of 360-degree evaluation is also a diversified evaluation method. This means that apart from teachers' evaluations, evaluations from peers, parents, social partners and other aspects are also included to obtain feedback information from multiple perspectives. For example, schools can invite classmates to evaluate the moral qualities of their peers, or parents to provide feedback on students' performance in off-campus community service activities.

5.3. Strengthen Teacher Training and Support

Teachers are the key facilitators of traditional virtues education, and their professionalism and pedagogical competence have a direct impact on students' moral character and ethical development. It is therefore crucial to provide teachers with adequate training and support to ensure that they are able to effectively impart moral education and participate in the evaluation process. For example, specialised training courses are provided for teachers to help them understand the core concepts, pedagogical methods and evaluation tools of traditional virtues education. The training may include the latest research developments in ethics education, case studies and sharing of practical experiences. For example, schools may invite experts to give lectures on the latest theories and methods of ethics education, while encouraging teachers to participate in seminars and research projects to enhance their professionalism. It is also crucial to provide teacher support networks and resources. Schools can set up collaborative platforms among teachers in order to share teaching materials, teaching experiences and assessment practices. Provide teachers with online resources, teaching materials and tools so that they can more easily integrate elements of traditional virtues education into the curriculum. For example, schools can create an online platform for teachers to share resources on ethical case studies and teaching activities.

5.4. Establishing Student Participation and Feedback Mechanisms

Students are the main beneficiaries of traditional virtues education. Their participation and feedback can help schools better understand the impact of educational activities on them, as well as stimulate their active participation and sense of reflection. The establishment of an effective student participation and feedback mechanism can help promote interactive education and active student participation. For example, students can be invited to share their experiences and views on traditional virtues education through regular student seminars or feedback sessions. These meetings can provide an open communication platform where students can express their views, concerns and suggestions on moral education. Schools can take this opportunity to understand students' needs and make adjustments and improvements to their traditional virtues education strategies based on their feedback. The online platform is also utilised to establish an anonymous feedback channel so that students can freely provide their opinions and suggestions. This approach allows for a wider collection of student feedback and enables schools to be more up-to-date with students' needs and responses. For example, schools can create an online suggestion box where students can anonymously submit questions and suggestions about moral education, and school management can respond and adopt helpful suggestions in a timely manner.

5.5. Promoting the Integration of Traditional Virtues Education and Disciplines

In order to better promote traditional virtues education in higher education institutions of architecture, integrating traditional virtues education with disciplines is a key strategy. This means organically integrating elements of traditional virtue education such as ethics, morality and social responsibility into the disciplinary curriculum, so that
students can cultivate moral qualities and a sense of social responsibility along with academic knowledge. For example, construction higher education institutions can design specific courses or modules to integrate moral and ethical issues into architectural design and engineering management programmes. Students will be asked to reflect on ethical decision-making, social impact and sustainability while learning professional knowledge. For example, in the architectural design programme, students may explore how to take into account social and environmental considerations in their projects, how to ensure the safety and maintainability of building projects, and how to comply with the relevant legal and ethical codes. In addition, schools can encourage students to participate in social practice projects, combining classroom learning with community service. By participating in social projects, students will have the opportunity to put into practice the ethical concepts they have learnt and experience the importance of ethical decision-making in the real world. This integration of discipline and practice will help to improve students’ ethical literacy and integrate traditional virtue education into their professional careers.

6. Conclusion

The optimisation of the evaluation system of traditional virtue education in higher vocational colleges of architecture is an important and complex task. By clarifying the evaluation objectives and standards, introducing diversified evaluation methods, strengthening teacher training and support, establishing a mechanism for student participation and feedback, as well as promoting the integration of traditional virtue education and architecture disciplines, the school can better cultivate skilled architectural professionals with moral qualities and a sense of social responsibility. This not only helps to improve the quality of education in schools, but also makes a positive contribution to the growth and success of students and the sustainable development of society. However, we also need to recognise that the establishment and optimisation of the evaluation system of traditional virtue education requires time and resources, and at the same time needs to be combined with educational practice for continuous and sustained improvement and refinement. Only through persistent exploration and innovation can the goal of traditional virtue education be better achieved, and students in construction higher vocational colleges and universities can effectively improve their ideological and moral qualities and civilisation, and truly become newcomers of the times in the construction industry who take on the great responsibility of national rejuvenation.
