Abstract: Green supply chain management (GSCM) is an advanced management approach that comprehensively considers the environmental impact, resource utilization efficiency, and enterprise income throughout the entire supply chain process. Compared to traditional supply chain management, GSCM exhibits higher complexity in terms of management and network characteristics. It emphasizes sustainable development for both society and enterprises, incorporating ecological and environmental protection design principles from raw material sourcing to waste material recycling, thereby achieving optimized environmental outcomes through enhanced cooperation within and between organizations. In essence, green supply chain management practices encompass green design, green procurement, green manufacturing, green packaging, green materials usage, and green recycling initiatives. The critical distinction between a green supply chain and a traditional one lies in the former's consideration not only of optimizing and coordinating the supply chain under conventional economic cost constraints but also recognizing the negative impacts of economic activities on the environment as significant factors warranting investigation. By embedding environmental awareness into supply chain management processes, it seeks to achieve a balanced approach that harmonizes the economy with environmental concerns. The proposition of adopting a green supply chain aligns with the developmental trajectory of economic globalization and free trade while meeting demands for environmentally friendly products and promoting greener trade.

1. Introduction

In today's globalized business landscape, supply chain sustainability has emerged as a pivotal determinant of success for companies. Traditional business models are no longer solely fixated on economic gains but increasingly prioritize environmental and social impacts. The primary source of environmental impact for most businesses stems from their supply chains. Due to the globalization of product manufacturing and distribution, supply chains often involve energy-intensive production and transportation processes. Consequently, companies can effectively mitigate their environmental footprint by initiating sustainable practices within the supply chain rather than focusing solely on internal operations. This report aims to analyze strategies for achieving environmental sustainability in globalized supply chains.

2. The Attainment of Environmental Sustainability in Supply Chains Within the Framework of Globalization

2.1. The primary challenges faced by the supply chain in the context of globalization

2.1.1. The volatility of the external environment

The uncertainty of the external environment is one of the main challenges facing the supply chain in the context of globalization. This uncertainty can come from many aspects, such as changes in the international situation, political risks, natural disasters, climate change, etc. These factors may have an impact on the stability and timeliness of the supply chain, resulting in disruption of the production and operation of enterprises.

To meet this challenge, companies need to take a number of measures. First of all, enterprises need to strengthen monitoring and early warning of the external environment, grasp possible risks and problems in a timely manner, and formulate corresponding response plans. Secondly, enterprises need to establish a more flexible supply chain management mechanism so that they can respond quickly and adjust when risks and problems arise. In addition, companies can work together to cope with the uncertainties of the external environment by building close relationships with suppliers and partners [1].

In the face of uncertainty in the external environment, enterprises also need to pay attention to risk control. This includes assessing and identifying risks that may exist in the supply chain and taking appropriate measures to prevent and control them. For example, enterprises can reduce the risk of supply chain disruption by establishing a diversified supplier system and developing emergency plans.

2.1.2. The management of risk poses a formidable challenge

A supply chain in the context of globalization inevitably requires a network of global suppliers, subcontractors, local factories, warehouses, transporters, customers, agents, after-sales services, etc. Within the supply chain, risks include information transmission errors, procurement or logistics disruption, warehouse management chaos, material planning disorder, etc. Outside the supply chain, market uncertainty, industry and economic cyclicality, policy and legal risks, natural disasters, and other irresistible risks will block or interrupt the supply chain.

The difficulty of risk control in the supply chain is mainly due to the complexity and uncontrollability of risk in the supply chain [2]. The supply chain covers multiple links and functional departments, and its risk control needs to consider multiple factors, such as suppliers, logistics, inventory, sales, etc. In addition, the information asymmetry and uncertainty
in the supply chain also increase the difficulty of risk control. In the face of these challenges, enterprises need to actively find countermeasures, such as establishing a more flexible supply chain management mechanism, improving the transparency and traceability of the supply chain, strengthening the communication and collaboration with suppliers and partners, and training and introducing comprehensive talents with multi-field knowledge.

In addition, establishing a sound supply chain risk control system and strengthening information sharing and communication are vital to solving the difficulty of supply chain risk control. At the same time, establishing a diversified supplier system, strengthening inventory management and introducing risk management tools can also improve the reliability and stability of the supply chain and reduce the risk of supply chain disruption or interruption.

2.1.3. Lack of comprehensive management talents

The need for integrated management talents is one of the challenges facing supply chain management in the context of globalization. As supply chain management requires knowledge and skills in multiple fields, such as purchasing, planning, logistics, production, quality, international trade, legal, etc., there is a high demand for general management talents. However, at present, such talents are relatively scarce, and enterprises need mechanisms for employees to work across departments, resulting in employees being unwilling to engage in essential work in different functional departments.

To address the issue of a shortage in comprehensive management talents, enterprises should enhance talent cultivation and recruitment. This can be achieved by intensifying internal training programs and external talent acquisition efforts, aiming to cultivate and attract individuals with diverse knowledge and skills across multiple fields. Additionally, establishing a mechanism for cross-departmental cooperation is crucial. By encouraging employees to collaborate and communicate across different departments, enterprises can foster a more integrated work environment. Furthermore, creating career development platforms and strengthening school-enterprise cooperation will provide employees with increased opportunities for professional growth and advancement [3]. Only through the implementation of these measures can enterprises effectively tackle the challenges posed by supply chain management in the era of globalization.

2.1.4. Supply chain performance is complex to evaluate

In the context of globalization, supply chain performance evaluation is a critical issue in supply chain management. Due to the complexity of the supply chain network and the uncertainty of risk, it is not easy to accurately measure the performance of the supply chain.

It is challenging to evaluate supply chain performance mainly because of the complexity of the supply chain and the uncontrollability of risk. The supply chain covers multiple links and functional departments, and its performance evaluation needs to consider multiple factors, such as on-time delivery, quality, cost, customer satisfaction, etc. In addition, the information asymmetry and uncertainty in the supply chain also increase the difficulty of performance evaluation.

Therefore, establishing a sound supply chain performance evaluation system and strengthening cross-departmental cooperation and communication is the key to solving the problem of complex supply chain performance evaluation [4]. At the same time, the introduction of third-party evaluation institutions and the establishment of reward and punishment mechanisms can also improve the accuracy and credibility of evaluation and promote the continuous improvement of supply chain management.

2.2. There are also many opportunities in globalized supply chains

2.2.1. Promote technological innovation in enterprises

Supply chains that are in the background of globalization can promote technological innovation in enterprises. When companies build close relationships with suppliers and partners around the world, they have access to more technical resources and innovation capabilities. These partners can help companies understand the latest technology trends and market needs, provide technical advice and support, and thus promote technological innovation.

At the same time, the supply chain in the context of globalization can also help enterprises introduce advanced production technology and equipment to improve production efficiency and quality. By establishing close cooperation with suppliers and partners, enterprises can introduce new production technologies and equipment faster and master the operation and maintenance knowledge of these technical equipment faster so as to upgrade and innovate products faster.

In addition, the supply chain in the context of globalization can help enterprises expand their market share and improve their competitiveness and sustainable development ability. By establishing cooperative relationships with global suppliers and partners, enterprises can better understand consumer needs and market trends in different countries and regions and adapt to market changes and customer needs faster, thus expanding market share and improving the competitiveness of enterprises.

In short, the supply chain in the context of globalization can promote technological innovation, improve production efficiency and quality, expand market share, and improve the competitiveness and sustainable development ability of enterprises [5]. Therefore, for enterprises, actively integrating into the supply chain in the context of globalization and strengthening the cooperative relationship with suppliers and partners is one of the essential ways to improve their competitiveness and sustainable development.

2.2.2. Expand market share

Supply chains in the context of globalization can help enterprises expand market share. By establishing partnerships with suppliers and distributors around the world, companies can better understand consumer needs and market trends in different countries and regions and adapt to market changes and customer needs more quickly. At the same time, the supply chain in the context of globalization can also help enterprises enter new international markets and expand sales scale and market share. Through cooperation with global suppliers and distributors, companies can better meet the needs of different countries and regions and enhance market competitiveness.

In addition, enterprises can expand their market share in a variety of ways. For example, the establishment of overseas branches can help enterprises directly enter the local market, understand the needs and preferences of local consumers, and improve brand awareness and market share. Participating in international exhibitions can show the product and technical strength of the enterprise and attract more potential customers and partners. The establishment of cross-border e-commerce can broaden the sales channels of enterprises and expand overseas market share.
In addition, the supply chain in the context of globalization can also help enterprises to obtain more resources and opportunities. For example, by working with global suppliers and partners, companies can access a wider choice of suppliers and reduce procurement costs. At the same time, these partners can also provide technical support, marketing, financial services, and other aspects of support to help enterprises explore the market better and expand their sales scale.

In short, the supply chain in the context of globalization can help enterprises expand market share, understand consumer demand and market trends in different countries and regions in a variety of ways, and adapt to market changes and customer needs more quickly [6]. At the same time, the supply chain can also provide more resources and opportunities to help enterprises better explore the market and expand the scale of sales.

2.2.3. Improve production efficiency

Supply chains that are in the background of globalization can improve the production efficiency of enterprises. When companies build close relationships with suppliers and partners around the world, they have access to more resources and technical support to optimize production processes and improve productivity.

First of all, the supply chain in the context of globalization can provide a wider choice of suppliers, enabling enterprises to adjust procurement strategies more flexibly and reduce procurement costs. By establishing long-term relationships with reliable suppliers, companies can obtain a more stable and reliable supply of raw materials, reducing the risk of production disruptions and delays.

Secondly, the supply chain in the context of globalization can also help enterprises introduce advanced production technology and equipment and improve the level of production automation and efficiency. These technologies and devices can optimize production processes, reduce human intervention and errors, and improve product quality and consistency. At the same time, the supply chain in the context of globalization can also provide technical support and training so that enterprises can better master and apply these technologies and equipment.

In addition, the supply chain in the context of globalization can also promote information sharing and collaborative work among enterprises. By establishing a close relationship, enterprises can better coordinate production and logistics plans and realize the optimal allocation and effective use of production resources. This sharing of information and collaborative working can reduce the risk of inventory overruns and stock shortages and improve the accuracy and flexibility of production planning [7].

In short, the supply chain in the context of globalization can improve the production efficiency of enterprises through a more comprehensive selection of suppliers, advanced production technology and equipment, information sharing and collaborative work, as well as a global procurement platform and a diversified supplier system. These measures can help enterprises optimize production processes, reduce costs, improve product quality and respond to market demand.

2.2.4. Enhance brand influence

Supply chains that are in the background of globalization can enhance the brand influence of enterprises. When companies build close relationships with suppliers and partners around the world, they have access to more resources and support, which enhances their brand image and awareness. First, supply chains in the context of globalization can provide a wider choice of suppliers, enabling companies to select better and more competitive raw materials and components, thereby improving product quality and consistency. Such high-quality products can enhance consumers’ trust and recognition of enterprises and improve brand image and reputation.

Secondly, the supply chain in the context of globalization can also help enterprises introduce advanced production technology and equipment and improve the level of production automation and efficiency. These technologies and equipment can make the production process of enterprises more efficient, flexible and reliable, thus providing better products and services. This efficient production process can improve the competitiveness of enterprises, attract more customers and consumers, and further expand the brand influence.

In addition, the supply chain in the context of globalization can also promote information sharing and collaborative work among enterprises. By establishing a close partnership, companies can better understand market needs and trends and adapt to market changes and customer needs more quickly. This ability to respond quickly to market changes can help companies provide more personalized and differentiated products and services that meet consumer needs and expectations, thereby enhancing brand loyalty and word-of-mouth.

In short, the supply chain in the context of globalization can enhance the brand influence of enterprises through better supplier selection, advanced production technology and equipment, information sharing and collaborative work, as well as global publicity platforms and diversified publicity channels [8]. These measures can help enterprises improve product quality and service level, enhance market competitiveness, and expand brand awareness and influence.

2.2.5. Enhance brand influence

Supply chains in the context of globalization can increase employment opportunities. By establishing partnerships with suppliers and partners around the world, companies can gain access to more business opportunities and market demands, thus creating more jobs.

First of all, the supply chain in the context of globalization can provide enterprises with more procurement and sales channels so that enterprises can expand the scale of production and sales, thus creating more employment opportunities. These channels can include overseas branches, cross-border e-commerce, international exhibitions, etc., providing enterprises with a broader range of resources and opportunities to promote the development and growth of enterprises.

Secondly, the supply chain in the context of globalization can also help enterprises introduce advanced production technology and equipment and improve the level of production automation and efficiency. These technologies and devices can reduce human intervention and errors, improve product quality and consistency, and thus reduce labour costs and job losses. However, these technologies and equipment also require more skilled people to operate and maintain, creating more skilled jobs.

In addition, the supply chain in the context of globalization can also promote the development of supply chain management and logistics, thus creating more job opportunities. With the expansion of the scale and complexity of the supply chain, enterprises need more professionals to
manage and optimize the supply chain process and improve the efficiency and flexibility of the supply chain. At the same time, the rapid development of the logistics field also requires more logistics professionals to engage in warehousing, transportation, distribution, and other aspects of the work.

Finally, the supply chain in the context of globalization can also provide enterprises with diversified business models and help them expand to new markets and business areas, thus creating more job opportunities. For example, enterprises can carry out cross-border sales business through cross-border e-commerce to expand overseas markets. It can provide more job opportunities by cooperating with overseas enterprises to carry out international cooperation projects. New jobs can be created by developing models such as emerging industries and the application of new technologies.

In short, supply chains in the context of globalization can increase employment opportunities by expanding procurement and sales channels, introducing advanced production technology and equipment, promoting the development of supply chain management and logistics, and expanding into new markets and business areas [9]. These measures can help enterprises expand production and sales scale, improve production efficiency and technical level, optimize supply chain management and logistics processes, and expand new markets and business areas, thus creating more employment opportunities.

3. Intel Corporation - Sustainable Supply Chain

Intel actively promotes supplier diversity and requires Tier 1 suppliers to implement diversity programs in their supply chain to provide more business opportunities for small and medium-sized suppliers and make the supply chain more inclusive and sustainable [10].

Intel Corporation proposed that a sustainable supply chain and ESG model of supplier management complement each other. To optimize sustainable supply chains, Intel sets social responsibility goals for suppliers through training and annual high-level exchanges. This includes providing suppliers with a "supplier report card" that includes sustainability metrics, including measures of sustainability, cost, quality, technology and customer satisfaction, and incorporating these considerations into supplier incentives and supplier Quality Continuous Improvement (SCQI) programs.

4. Conclusion

The best practice for achieving supply chain sustainability is to integrate sustainability strategies into corporate strategies. This includes setting goals, setting benchmarks and aligning sustainability activities with the company's vision and values.

Sustainability plans should cover the entire value chain from raw material extraction to end-of-life product disposal. Companies can identify areas where sustainable practices have the most significant impact and collaborate with suppliers and other stakeholders.

In addition, incorporating sustainability into the business plan helps to gain stakeholder support and make sustainability a vital component of the business vision.
